

IMPORTANT NOTES REGARDING YOUR GRANITE WORKTOP

- Granite is a natural stone & therefore is subject to variation in colour, texture, veining and shade.
- It is important to know that the polish on a recess drainer may differ slightly in shade and appearance to that of the overall worktop. This is more obvious on some materials that have been pressure treated with a sealer during block production and it is virtually impossible to get an exact match between the recessed area & the rest of the worktop.
- The area in front of the hob and sink are the weakest points of the countertops. Please ensure that no body stands on these areas to open windows/paint around this area etc. Granite tops will not accept any liability for damage caused by other trades people.
- Pure black granite has become very popular in recent times. We must emphasis to those who seek perfection in life that this is extremely difficult to maintain because of its nature it shows the slightest imperfection.
- You must clean all spillages of liquid and food off of the worktop area as soon as possible. Leaving the area soiled can cause your granite countertop to stain.
- All worktops are sealed before leaving our factory and are given a final coat of sealer once installation is finished.
- Daily granite countertop care is as easy as cleaning any other worktops. Using a light detergent or washing up liquid in water can keep your counters sparkling clean.
- Cleaners for stone worktops are also available from all major supermarkets. If you are unsure as to what cleaner is best to use, you can contact us in the office and we would be more than happy to advise what to use.
- Steps to keeping your countertops looking great - Wipe up spills immediately - Use mild soap and water - Rinse thoroughly using tissue paper or a cloth. - Buff clean using a microfiber cloth.
